# BABY BOOM

explode your results by putting Baby Boom in your reproductive program.

## About Baby Boom

Quality eggs start long before you begin to even think about cycling your ewes. Baby Boom is developed to be fed during lactation of the prior lambing cycle. Science has shown that 4 cycles of egg quality can be affected by what happens prior to lambing.

## How to Use

Simply add 0.20 lbs per head per day as a top dress to your existing diet for a minimum of 30 days prior to flush or AI. As a loose product, it mixes well with grain if you are hand feeding or adding to a mixer wagon for larger loads. To achieve the highest results, feeding Baby Boom for 3-5 months prior to breeding will ensure that all eggs that have yet to be ovulated will be prepared to their uppermost level.
